

Q - RESTOBAR

CMS FAQ AND FEATURE GUIDE

Run the restaurant. Not the paperwork.

A simple guide for restaurant owners who want to manage reservations, menus, pricing, promotions and business information from one control panel.

Reservations

Receive enquiries, follow up with guests and track every booking from new request to completion.

Menu and pricing

Update dishes, prices, categories, availability and Chef's Picks without rebuilding the website.

Offers and events

Control brunches, ladies nights, live DJ events, celebrations and private venue promotions.

Restaurant settings

Keep contact details, opening hours, dress code, taglines and announcement banners accurate.

Built for owners

No coding is required for normal day-to-day updates. If you can use an online form, you can use this CMS.

DEMONSTRATION EDITION | SEPTEMBER 2026

START HERE

What is a restaurant CMS?

Is a CMS the same as a website?

No. The website is what your customers see. The CMS is the private control room used by the restaurant team. Changes made in the CMS can be reflected on the public website once the live database connection is enabled.

Why does a restaurant need one?

A normal website can become outdated quickly. A CMS lets the business update menu prices, mark an item unavailable, publish a promotion, change opening hours and manage reservations without calling a developer for every small change.

Simple comparison

Website = the dining room customers see. CMS = the office where the restaurant team controls the information.

Overview screen: a single place to monitor bookings, menu items and promotions.

Who should use it?

The owner, manager, reservation team or trusted marketing staff.

Does it need training?

Only a short walkthrough. The controls use familiar labels, buttons, filters and forms.

Will customers see the CMS?

No. Customers use the public restaurant website. The CMS is protected by an admin login.

What is the goal?

Faster updates, fewer missed enquiries and one reliable source of restaurant information.

01 OVERVIEW

Your 30-second business snapshot

The Overview page answers the owner's most important daily questions immediately: Are new customers waiting? How many bookings are confirmed? Is the menu current? Which promotions are live?

Dashboard item	What it means	What the owner should do
New table requests	Bookings that have arrived and still need staff review.	Open them first and contact the guest.
Confirmed bookings	Reservations accepted and ready for planning or seating.	Use the count for service preparation.
Active menu items	Items currently available on the public menu.	Check sold-out dishes and pricing.
Active promotions	Offers and event cards visible to customers.	Confirm dates, wording and availability.
Latest requests	A working list of recent reservations.	Search, review, update or remove records.

What does the search bar do?

It helps staff find a booking by customer name, reference code, phone number or email instead of scrolling through the full list.

What do the status tabs do?

They filter the same reservation list into New, Contacted, Confirmed, Seated, Completed and Cancelled. These are not separate databases.

What is Export CSV?

It downloads reservation information into a spreadsheet-friendly file. This can be used for reporting, planning or an internal backup of the visible records.

Best habit

Check New Table Requests at the start of every shift. A fast response improves the chance that an enquiry becomes a confirmed booking.

02 RESERVATIONS

Every booking, clearly organised

Reservations screen: search, filter, review, update status and export records.

Field	Plain-English meaning
Reference code	A unique booking number for quick identification.
Date and time	When the guest wants to dine.
Customer name	Guest identity plus the available contact information.
Guests and area	Party size and requested seating area, such as indoor or outdoor.
Occasion	Birthday, anniversary, business meal, date night or another reason for visiting.
Status	The current stage of the booking.
Actions	View the full record or delete it when appropriate.

Practical benefit

The reservation team can see who needs attention, who has confirmed and which guests have already been seated without relying on loose papers or scattered messages.

RESERVATION WORKFLOW

What happens after a customer submits?

1. New A request arrives from the reservation form. Staff should check the date, time, party size and contact details.	2. Contacted The team has called or messaged the guest but is still waiting for final confirmation.
3. Confirmed The booking is accepted and can be included in the service plan.	4. Seated The guest has arrived and is now at the table.
5. Completed The visit is finished. The record remains useful for reporting and customer history.	6. Cancelled The guest or restaurant has cancelled the booking. The record is retained for operational reference.

Where do new requests currently come from?

In this demonstration, sample records and form submissions are stored in the browser's LocalStorage. They are intended to show how the finished system will work.

Will a booking entered on one computer appear on another?

Not in LocalStorage demo mode. Once Supabase is connected, authorised devices can read the same central online database.

Does Contacted mean a separate contact database?

No. Contacted is simply a status attached to the same reservation record. It tells the team that someone has already followed up.

Can a status be changed?

Yes. Staff can use the status dropdown to move the reservation through the workflow as the situation changes.

Should staff delete cancelled bookings?

Usually no. Keeping them provides a more complete operational history. Delete only duplicate, test or clearly incorrect records according to the restaurant's data policy.

When the site goes live	The customer form will create a record in Supabase. The CMS will retrieve it, authorised staff will update it, and the change will remain available across approved devices.
--------------------------------	--

03 MENU AND PRICING

Keep the digital menu accurate

Menu and Pricing screen: manage dishes, categories, prices, availability and Chef's Picks.

Control	What the team can manage	Business value
Search	Find a dish by name or description.	Faster editing during service.
Categories	Filter signatures, small plates, grill, seafood, vegetarian, desserts, cocktails and more.	Keeps a large menu organised.
Add new menu item	Create a dish with image, name, description, category and price.	Launch new items without rebuilding the site.
Chef's Pick	Highlight selected dishes.	Guides guests toward signature items.
Availability	Mark an item in stock or unavailable.	Avoids orders for sold-out dishes.
Edit and delete	Correct details or remove an item.	Keeps public information reliable.

Can prices be changed immediately?

Yes in the CMS. In the connected production version, saving the update can refresh the public digital menu without a developer editing the website code.

04 OFFERS AND EVENTS

Turn promotions on, edit them and keep them current

Offers and Events screen: six promotional cards, each with live status and edit control.

This section controls promotional posters and event information shown on the Homepage and Offers page. It is designed for recurring activities as well as seasonal campaigns.

Offer type Labels such as Weekend Special, Popular Night, Nightlife, Celebrations, Executive or Exclusive Buyout.	Title and schedule The customer-facing event name plus the day and operating time.
Description A short explanation of the food, music, experience or package.	Live status Shows whether the campaign is currently visible on public pages.
Edit Offer Change wording, schedule, image, terms or other supported details.	Poster control Keep promotional visuals connected with the correct event card.

Owner's check	Before publishing, verify the date, time, price or cover charge, booking conditions, image and contact path. An attractive poster still needs accurate information.

Reset Demo Data to Factory Defaults

SAVE ALL SETTINGS

Restaurant Settings screen: brand, contact channels, hours, dress code and announcement banner.

Settings group	Information controlled	Where customers may see it
Brand identity	Primary name, secondary name, main tagline and location area.	Website header, hero, footer and brand sections.
Contact channels	Telephone, WhatsApp, enquiry email and address.	Contact page, booking assistance, quick links and footer.
Hours and dress code	Summary hours, weekday details, weekend details and guest policy.	Contact information and visit-planning sections.
Announcement banner	A temporary message and an on/off control.	Top website banner for promotions or important notices.
Save all settings	Commits the current values.	Updates become available to the connected website.

Use caution

Reset Demo Data restores factory demonstration content. It is useful during presentations but should not be treated as a normal daily action.

SYSTEM CONTROLS

What the top buttons mean

LocalStorage Demo Mode Confirms that the current data is stored inside the browser for demonstration. The system is prepared for a future Supabase connection.	Theme button Switches the CMS visual appearance where the light and dark theme option is enabled.
Reset Demo Returns sample information to the original demonstration state.	View Website Opens the customer-facing restaurant website so staff can review the public experience.
Logout Ends the current admin session and returns the user to the login screen.	Navigation tabs Moves between Overview, Reservations, Menu and Pricing, Offers and Events, and Restaurant Settings.

Demo mode compared with the production system

Question	Current demonstration	Supabase production setup
Where is data stored?	Inside one browser using LocalStorage.	In a central hosted database.
Can another device see it?	Usually no.	Yes, after authorised login.
Is it suitable for live customers?	For showcase and testing only.	Yes, after deployment and security checks.
How is admin access protected?	Temporary demo login.	Supabase Auth plus access policies.
Can data survive browser clearing?	Not guaranteed.	Yes, subject to database retention and backup settings.
Can updates sync reliably?	Only within the current browser.	Yes across connected website and CMS sessions.

Important	The word 'Supabase Ready' means the interface and migration path have been prepared. It does not mean Supabase is already connected.
------------------	--

LOGIN, SECURITY AND DATA

Questions every owner should ask

Is the CMS public?

The CMS link may be visible for a demonstration, but the dashboard itself should require an admin login. In production, only approved staff accounts should be permitted.

Is the temporary demo password enough for launch?

No. Any shared demonstration password should be replaced before a public launch. Production access should use named accounts, strong passwords and proper authentication.

What is Supabase Auth?

It is the login and identity layer planned for the production system. It helps the CMS recognise who is allowed to sign in.

What are access policies?

They are database rules that decide who may read, create, edit or delete information. This prevents public visitors from opening private reservation records.

Will customers' personal details be protected?

They must be treated as private business data. The production setup should use secure connections, restricted accounts, appropriate retention rules and controlled exports.

Can staff have different permissions?

Yes. A future role system can give owners full control while allowing reservation or marketing staff to access only the sections they need.

Should CSV exports be shared casually?

No. They may contain customer names, phone numbers or emails. Store them securely and share them only with authorised staff.

Minimum go-live checklist

Step	Required outcome
1. Connect database	Apply the approved Supabase database structure and test every form.
2. Enable authentication	Replace the temporary login with secure staff accounts.
3. Apply access rules	Protect reservation and business data from unauthorised access.
4. Test all devices	Confirm bookings and edits appear correctly across approved browsers and devices.
5. Prepare backup and support	Define export, recovery, monitoring and maintenance responsibilities.

OWNER PLAYBOOK

A simple routine for getting value from the CMS

When	Recommended actions
Start of shift	Review New reservations, respond to pending guests, check confirmed covers and mark unavailable dishes.
Before service	Review special occasions, seating areas, large parties, dietary notes and live promotions.
During service	Update arrivals to Seated, correct availability and keep the reservation team informed.
End of shift	Mark finished visits Completed, record cancellations and check tomorrow's confirmed bookings.
Weekly	Review menu prices, event schedules, opening hours, banner messages and exported booking totals.
Monthly	Review customer demand, popular occasions, promotions, menu performance and staff access.

What business problems does it solve?

Missed enquiries New requests are visible in one queue instead of being buried across messages.	Outdated menus Prices and availability can be maintained from one control panel.
Confused staff A shared status shows what has already been handled.	Slow promotion changes Offers can be updated without rebuilding the whole website.
Wrong business details Contact information, hours and policies are controlled centrally.	Weak reporting Filters and CSV exports provide a practical starting point for review.

Do I still need a web developer?

Not for routine content updates supported by the CMS. A developer or support partner is still useful for new features, technical maintenance, database changes, security and major design work.

Can the system grow later?

Yes. Possible upgrades include automated confirmation messages, capacity controls, deposits, customer profiles, analytics, staff roles, email notifications and integrations with restaurant operations.

The main idea

A website attracts the customer. The CMS helps the restaurant act on that interest and keep the public information useful.

READY FOR THE NEXT STAGE?

From polished demonstration to live restaurant operations

The QRestoBar CMS already demonstrates the complete management experience. The production stage connects the public forms, database, secure staff login and website content into one reliable system.

Connect

Move reservations and content from browser-only demonstration storage to Supabase.

Secure

Introduce production authentication, staff access controls and protected customer records.

Test

Verify public forms, CMS updates, mobile behaviour, exports and cross-device consistency.

Launch

Deploy the approved system and provide staff onboarding, maintenance and support.

Q - RESTOBAR

MODERN MALAYSIAN DINING, REIMAGINED.

This guide describes the QRestoBar CMS demonstration shown in the supplied screens. Final production behaviour depends on the approved Supabase, authentication, access-control and deployment configuration.
